

Waste is anything that adds time without adding Value.

Form of Waste		Definition	Examples
	Defects	<ul style="list-style-type: none"> Errors or deficiencies in work product. 	<ul style="list-style-type: none"> Code defect in production Security vulnerability Broken build Server misconfiguration
	Waiting	<ul style="list-style-type: none"> Any delay that impedes value delivery 	<ul style="list-style-type: none"> Service Tickets Waiting on environments Slow build or test runs Batch processing
	Extra Features	<ul style="list-style-type: none"> Feature bloat, over-design, duplicative work, or gold plating that is not required. 	<ul style="list-style-type: none"> Overly complex systems Unnecessary configuration settings Repeating processes
	Non-Utilized Talent	<ul style="list-style-type: none"> A failure of the system to use human intelligence or allow smart decision making. Overuse of “Heroes” 	<ul style="list-style-type: none"> Rigid automation Single person bottleneck Overspecialization Broken standard process
	Re-Learning	<ul style="list-style-type: none"> Failure to capture knowledge, especially around known issues or process, forcing repeat work to occur later 	<ul style="list-style-type: none"> Tribal knowledge Recurring issues not documented or repaired Documents created not used
	Handoffs	<ul style="list-style-type: none"> Work hand off between individuals, organizational groups, or to contractors or third parties internal or external 	<ul style="list-style-type: none"> Any handoff between one team to another Handoffs between automated systems
	Task Switching	<ul style="list-style-type: none"> A person in the value stream forced to stop work on one task to start a new, unrelated task 	<ul style="list-style-type: none"> Redefined Priorities Interruptions Engineers switch between multiple project teams
	Partially Done Work	<ul style="list-style-type: none"> Work product that is partially done and must be finished or re-worked later in the value stream. 	<ul style="list-style-type: none"> Deployment script is wrong, Ops teams fixes it Feature not well defined, requiring redevelopment

Countermeasures are actions that reduce waste in the value stream

Form of Waste		Possible Organizational Countermeasures	Possible Automation Countermeasures
	Defects	<ul style="list-style-type: none"> ▪ Increase feedback loops (builds, tests, scans) ▪ Training 	<ul style="list-style-type: none"> ▪ Code Scanning ▪ Automated Testing ▪ Automate System Verifications ▪ Access to prod-like environments
	Waiting	<ul style="list-style-type: none"> ▪ Lower work in progress (WIP) ▪ Create slack in system to increase flow (lower resource utilization) 	<ul style="list-style-type: none"> ▪ Self service environments ▪ Minimize handoffs ▪ Automated approvals
	Extra Features	<ul style="list-style-type: none"> ▪ Smaller features ▪ Time dedicated to refactoring and system enhancements ▪ Reduce handoffs 	<ul style="list-style-type: none"> ▪ Refactor system (Reduce technical debt) ▪ Eliminate duplicate processes
	Non-Utilized Talent	<ul style="list-style-type: none"> ▪ Increase trust in technical teams ▪ Cross-train ▪ Decentralize or democratize 	<ul style="list-style-type: none"> ▪ Un-automate things that have high error rates ▪ "Andon cord" capability
	Re-Learning	<ul style="list-style-type: none"> ▪ Update processes often ▪ Document tacit knowledge ▪ After action reviews 	<ul style="list-style-type: none"> ▪ Automate Runbook ▪ Wiki-like knowledge base ▪ ChatOps capability for sharing both system data and knowledge
	Handoffs	<ul style="list-style-type: none"> ▪ Team re-organization by value stream ▪ Streamline process ▪ Cross-train staff ▪ Standardize work practices 	<ul style="list-style-type: none"> ▪ Single system across teams ▪ ChatOps and cross team communication tools ▪ Common source control for Dev and Infrastructure artifacts
	Task Switching	<ul style="list-style-type: none"> ▪ Reduce defects, rework ▪ Minimize unplanned work ▪ Dedicated staff to teams ▪ Quiet Hours 	<ul style="list-style-type: none"> ▪ Use of Do Not Disturb settings ▪ Improvements to reduce defects, waiting, handoffs
	Partially Done Work	<ul style="list-style-type: none"> ▪ Enforce standards at phases ▪ Checklists for completeness ▪ Lower Work in Process 	<ul style="list-style-type: none"> ▪ Automated acceptance testing ▪ Automate work advancement (e.g. reject builds where tests fail) ▪ Self service environments (fully done on demand)
